

Manual of Diagnostic Tests for Aquatic Diseases:

Protocol For The Proposed New Confirmatory Test For Spring Viraemia Of Carp

There is a typographical error in the sixth paragraph of the protocol which is identified below in red text (web site address should not have a space between the words fish and pathogen):

All amplified products are confirmed as SVCV in origin by cloning¹² and sequencing, subtype (Ia-Id) is identified using a BLAST search (<http://www.ebi.ac.uk/blastall/index.html>) or by phylogenetic analysis using the SVCV sequences available in the fish pathogen.net database. Phylogentenetic analysis is undertaken using a 550 bp region corresponding to nucleotides 405–954 of the glycoprotein gene.

The corrected red text is provided below:

All amplified products are confirmed as SVCV in origin by cloning¹² and sequencing, subtype (Ia-Id) is identified using a BLAST search (<http://www.ebi.ac.uk/blastall/index.html>) or by phylogenetic analysis using the SVCV sequences available in the fishpathogens.net database. Phylogentenetic analysis is undertaken using a 550 bp region corresponding to nucleotides 405–954 of the glycoprotein gene.
